# Mean function

Consider an averaging function on square window. In general, the window can have different size of each dimension. The output of the averaging is determined by.

$$I'(u,v) = \frac{1}{(2r+1)\times(2r+1)} \sum_{i=-r}^{r} \sum_{j=-r}^{r} I(u+i,v+j)$$

 $I^{'}(u,v)$  can be written as

$$I^{'}(u,v) = \sum_{i=-r}^{r} \sum_{j=-r}^{r} I(u+i,v+j).H_{corr}(i,j)$$

LE Thanh Sach

#### Local processing

# Linear processing

#### Correlation

#### Convolution

# **Mathematics**

$$I'_{conv}(u,v) = \sum_{i=-r}^{r} \sum_{j=-r}^{r} I(u-i,v-j).H_{conv}(i,j)$$

$$I'_{corr}(u, v) = \sum_{i=-r}^{r} \sum_{i=-r}^{r} I(u+i, v+j).H_{corr}(i, j)$$

In mathematics, convolution and correlation are different in the  ${\bf sign}$  of i and j inside of I(u+i,v+j) and I(u-i,v-j)

Local Processing of Images

LE Thanh Sach

Local processing

Linear processing

#### Convolution

#### **Convolution to Correlation**

- Let s=-i and t=-j
- We have

$$I'_{conv}(u, v) = \sum_{i=-r}^{r} \sum_{j=-r}^{r} I(u - i, v - j).H_{conv}(i, j)$$

$$= \sum_{i=-r}^{r} \sum_{j=-r}^{r} I(u + s, v + t).H_{conv}(-s, -t)$$

$$H_{conv}(-s,-t)$$
 from  $H_{conv}(i,j)$ 

 $H_{conv}(-s,-t)$  can be obtained from  $H_{conv}(i,j)$  by either

- Flipping  $H_{conv}(i,j)$  on x and then on y axis
- Rotating  $H_{conv}(i,j)$  around its center  $180^0$

Local Processing or Images

LE Thanh Sach

Local processing

Linear processing

Convolution

# **Example**

Demonstration of rotation and flipping.

$$H = \begin{bmatrix} \textcircled{1} & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix} \quad H_{flipped\_x} = \begin{bmatrix} 3 & 2 & \textcircled{1} \\ 6 & 5 & 4 \\ 9 & 8 & 7 \end{bmatrix}$$

 $H_{flipped\_x}$  is obtained from H by flipping H on x-axis. After flipping  $H_{flipped\_x}$  around y axis

$$H_{flipped\_xy} = \begin{bmatrix} 9 & 8 & 7 \\ 6 & 5 & 4 \\ 3 & 2 & \textcircled{1} \end{bmatrix}$$

 $H_{flipped\_xy}$  can obtained from H by rotating H  $180^{0}$  around H's center.

### Sliding window technique for correlation

For each pixel (u, v) on the output image, do:

- **1) Place** matrix  $H_{corr}$  centered at the corresponding pixel, i.e., pixel (u, v), on the input image
- **2** Multiply coefficients in matrix  $H_{corr}$  with the underlying pixels on the input image.
- **3** Compute the sum of all the resulting products in the previous step.
- **4** Assign the sum to the I'(u,v).

Convolution can be computed by rotating the kernel  $180^{\circ}$ followed by the above algorithm.

### Computational Complexity of sliding window technique

- Input image I has size  $N \times M$
- Kernel's size is  $(2r+1) \times (2r+1)$
- Then, the number of operations is directly proportional to:  $MN[(2r+1)^2 + (2r+1)^2 - 1]$ .
- The computational complexity is  $O(MNr^2)$

### Attention!

- The cost for computing convolution and correlation is directly proportional to the kernel's size!
- The filtering process will be slower if the kernel's size is bigger.
- The computational cost of the implementation in frequency domain is independent with the kernel's size.

Convolution's implementation

Because, we have

### **Associativity:**

$$(I * H_1) * H_2 = I * (H_1 * H_2)$$

# So, we can save the computational cost by using separability

If we can separate a kernel H into two smaller kernels  $H=H_1*H_2$ , then it will often be cheaper to apply  $H_1$  followed by  $H_2$ , rather than H.

### **Example**

Kernel H can be decomposed into  $H = H_1 * H_2$ , as follows:

$$H_1 = \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix} \quad H_2 = \begin{bmatrix} -1 & 0 & 1 \end{bmatrix}$$

$$H = H_1 * H_2 = \begin{bmatrix} -1 & 0 & 1 \\ -2 & 0 & 2 \\ -1 & 0 & 1 \end{bmatrix}$$

Using associativity, we can filter image I with H by either

**1** Method 1: I' = I \* H

**2** Method 2:  $I' = (I * H_1) * H_2$ 

Which method is better?

## A method for computing S(u, v)

- 1 for each element in the first row and the first column in S(u,v), assign zero to it.
- 2 for each remaining element at (u,v): S(u,v) = S(u-1,v) + S(u,v-1) S(u-1,v-1) + I(u,v)

## CASE 2: 2D-array

## The Way to compute the filter's response

- ① Let A,B,C,andD are the sum of all pixels in rectangle from O to A,B,C,andD respectively.
- **2** The sum of pixels inside of rectangle ABCD is (C-B-D+A)

### CASE 2: 2D-array

## The Way to compute the filter's response

$$I'(u_2, v_2) = C - B - D + A$$
  
=  $S(u_2, v_2) - S(u_1, v_2) - S(u_2, v_1) + S(u_1, v_1)$
